## Project Update

To this day we advance with the use, architecture and implementation of the database in our program which we decided to use Django for our website, in future advances we have contemplated adding to the top of the page a carousel of photos to make the page more interactive with users and give it a more aesthetic touch, guitars of all kinds of material will be added both handmade or more to large quantities, recognized brands and their logos will be added at the beginning so that their search is easier and that the user knows that if he can find the guitar sought.

## Task analysis

We had problems in keeping a rhythm for the programming of the estimate that we had planned, but little by little it was elaborated and finishing tasks, we are going in the early stages, but we are already about to develop what is the interaction with the users and we are going to a good step to make it functional.

## User model

For the user model there is the user who only wants to see the information which will not have the access that a registered user would have, which would not only go to the main page and that of a user in the process of registration leads the user to a window which asks for mail and password for registration, then a page within the website with which you will put the most basic information to complete the entire registration and from there be able to configure the design of your user and the other user would be that of the administrator who would have a special email to be able to have control of the page to modify, add and delete things from the page.
